Drive Testing in London since 2018

Emerging Issues around Autonomy

Autonomous Systems are being widely deployed in settings (e.g. self-driving cars, warehouse robots, trading agents):

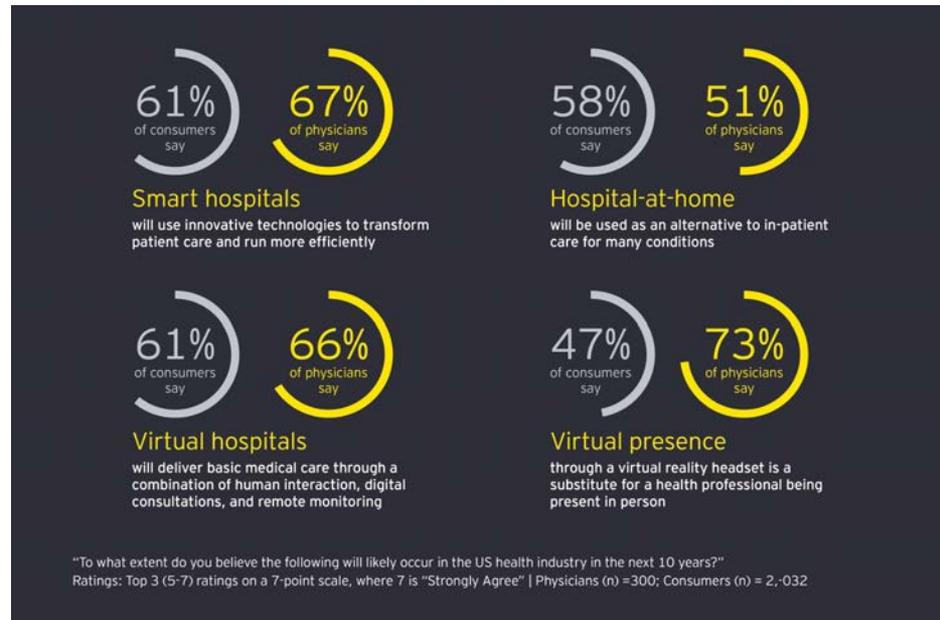

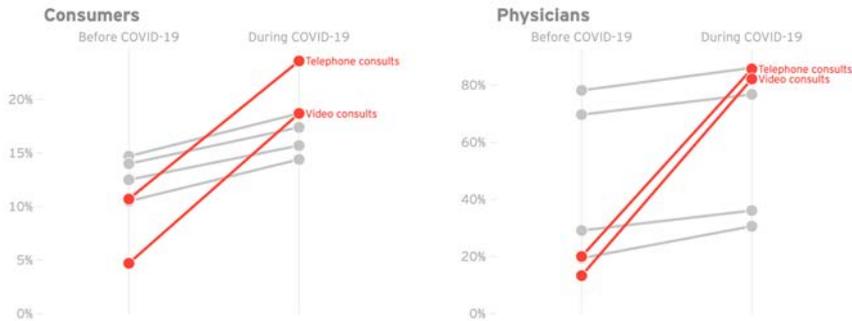

- where more of the decision-making role is handed over to a machine
- where it affects a much broader set of stakeholders, and sometimes bystanders who were otherwise out of the loop
- where workflows are becoming significantly redefined due to this

The last point raises entirely new issues, e.g. due to:

- Shifts from expert-defined model and specs to data and labels
- Emergence of *continual* deployment pipelines and evolving functionality

Broad Landscape: Increasing Adoption of Digital Technologies, e.g. in Healthcare

● Remote consultation technologies
● Other digital technologies

Use of artificial intelligence for image analysis in breast cancer screening programmes: systematic review of test accuracy

BMJ 2021 ; 374 doi: <https://doi.org/10.1136/bmj.n1872> (Published 02 September 2021)

Cite this as: BMJ 2021;374:n1872

Conclusions Current evidence for AI does not yet allow judgement of its accuracy in breast cancer screening programmes, and it is unclear where on the clinical pathway AI might be of most benefit. AI systems are not sufficiently specific to replace radiologist double reading in screening programmes. Promising results in smaller studies are not replicated in larger studies. Prospective studies are required to measure the effect of AI in clinical practice. Such studies will require clear stopping rules to ensure that AI does not reduce programme specificity.
